### **Solar Panel Installation Complete for New Auburn University Bus Stop Transit Station**

A tornado and a day of snow did not deter Compass Solar Energy from completing installation of 9800 watts of solar electric panels on the new bus stop transit station at Auburn University.

The University contracted Compass Solar Energy, based in Pensacola, Florida, after a solar power offset was built in to the design process for the Transit Station located in front of the University dorms.

The solar panels installed were Sanyo Bi-facial Panels, which can absorb energy from both sides. A University spokesperson said that everyone is excited about the energy saving measure, and look forward to more green initiatives throughout the campus.
